

SIZING DUST COLLECTOR BAGS FOR MAXIMUM EFFICIENCY

1. Determine CFM of dust collector. 2. Select best bag size from chart. 3. Call us for cost of dust bag plus options.

Many factors affect the performance of your shop's dust collection system. They include horsepower of the motor, fan design; duct lengths, branches and bends, collection containers and air filtration bags. Of all these items, replacing original woven cloth bags with new felt bags is by far the most immediate and cost-effective way to improve system performance as well as workshop air cleanliness. Follow the steps below to find what you need.

Charts below are for high airflow 10 oz. Shaker Felt, singed on one side. If using your fan's maximum CFM rating, read off the maximum chart. Use the lower chart for "under load" CFM calculations. **Always select a size with at least 50% to 100% extra capacity to minimize backpressure and help disburse dust-laden air.**

Calculations and specifications are approximate. Results may vary under actual working conditions. For commercial applications use heavier 12 oz. and 16 oz. felts and design systems for 10 (or less) CFM per square foot.

- Dust collector brand & model: _____ Size of output fitting : _____ Dia / Circ / Flat Width
- Rated output: _____ CFM (max) _____ CFM (under working load) Type of dust: _____
- Is your bottom bag (the collector) felt? **NO.** All air will exit through top bag(s). **YES.** It's part of my system. Add in its size and CFM also, then reduce its value by 50% to account for any losses due to full bag.
- If same bag used for both filtration and collection, reduce value by 50% to account for loss due to dust in bag.
- Size restrictions (low ceiling, output-to-floor distance, support hook height, etc.)? _____

55 CFM/SQ FT - MAXIMUM AIRFLOW CONDITIONS

EXAMPLE:

XYZ-brand dust collector, with an 20 in. dia output fitting, is rated at 800 CFM maximum and 500 CFM working (under load). Its collector is a 55 gal drum, so all air exits through the top bag. Look for a bag that will handle 1200 to 1600 CFM maximum, or 750 to 1000 CFM working (under load) output. From these charts we find the bag should be 20 in. in diameter by 4 to 5 ft. long.

3 Ways to Determine Bag Size

DIAMETER CIRCUMFERENCE

Measure across outside of output

Measure around outside of output

FLAT WIDTH

Fold old bag flat. Measure full width

FYI
Circumference divided by 3.14 (Pi) equals the Diameter

Flat Width equals one-half the Circumference.

40 CFM/SQ FT - HEAVY WORKING CONDITIONS
