

Did a rip in a sifter screen just bring your production line to a complete halt?

Your first thought is *how fast can it be re-screened?* But *how well* a sifter screen is stretched can be just as important as *how fast* you can get it repaired. To ensure correct and consistent openings in a sifter screen the fabric must be stretched uniformly and tightly in both length and width. AFF's new power stretcher uses pneumatically balanced stretcher bars to evenly apply bi-directional pressure across the fabric and give you the precise openings you require. Call AFF for fast, high quality rescreening service. **Rush Service available.**

Frames up to 4ft. squared are re-screened in as little as one day with most stock synthetic and stainless steel fabrics.

AFF also manufactures and repairs numerous screening products for all industries.
